

Table 2. Robustness and detectability on Llama-2-7B across attack conditions. For each condition, we report AUROC (AUC), TPR at 1% FPR, and keyless z-score ((Liu et al., 2025)). Higher AUC and TPR indicate stronger robustness; lower z-score indicates reduced detectability with respect to this detector. Superscripts denote families: ^BBiased, ^FBias-free, ^SSemantic, ^DDist-preserving, ^WTraining-time, ^{*}Hybrid. DAWA is reported as a separate co-designed baseline, and its z-values are shown using a mean per-sample standardized external score so they are comparable in scale to the other rows. Back-translation induces substantially higher edit rates ($\hat{\epsilon} \approx 0.42$), causing all families to degrade; the Hybrid scheme consistently lies near the empirical Pareto frontier among evaluated methods.

	No attack			DIPPER ($\hat{\epsilon} \approx 0.25$)			OPT-2.7B ($\hat{\epsilon} \approx 0.15$)			WM-removal ($\hat{\epsilon} \approx 0.15$)			Synonym ($\hat{\epsilon} \approx 0.15$)			Back-trans. ($\hat{\epsilon} \approx 0.42$)
